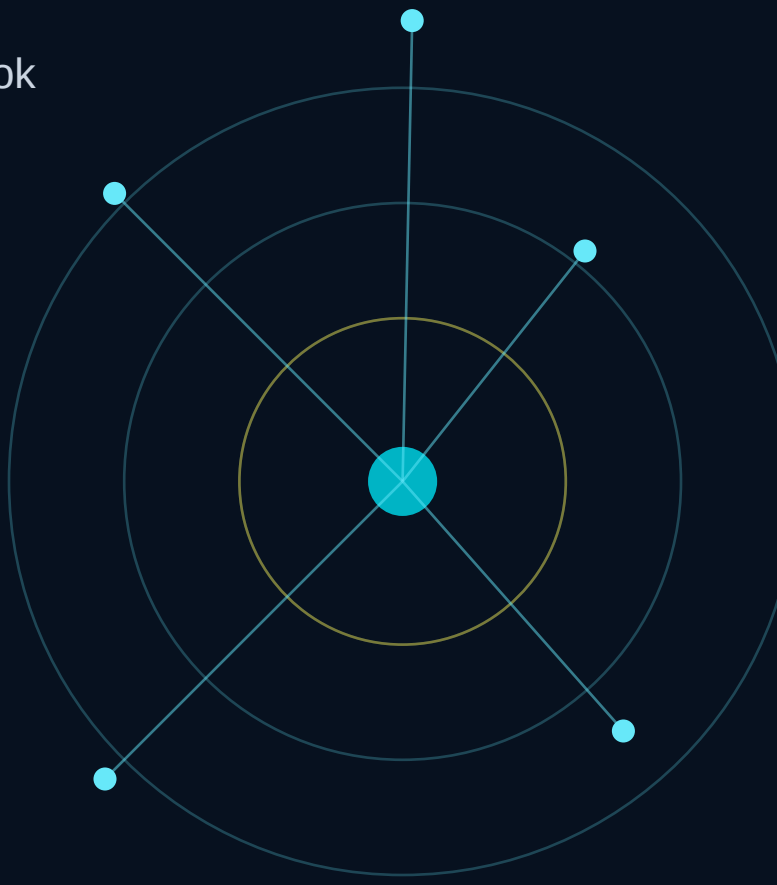
ROALLA EXECUTIVE INSIGHT

From Unified Communications to Unified Intelligence

2027 UCaaS & CCaaS Industry Outlook



SEVEN TRENDS / READINESS ASSESSMENT / 90-DAY ROADMAP

CONNECTED. INTELLIGENT. TRUSTED.

EXECUTIVE THESIS

The interaction system becomes the operating system for experience.

By 2027, advantage will come less from adding another channel and more from preserving context, applying AI responsibly and completing work across the full interaction. UCaaS and CCaaS will increasingly be managed as one experience architecture: identity, conversation, knowledge, workflow, data and trust.

The strategic shift	The leadership question
From channel availability to outcome orchestration.	Can every interaction carry its context, controls and next action across the enterprise?

The intelligent interaction fabric

A useful target architecture connects every conversation to identity, knowledge, workflow and evidence while keeping human accountability visible.

Customers & employees	Channels & conversations	AI & orchestration	Knowledge & workflow	Data, trust & resilience

TREND 01

AI moves from assistant to participant

AI will summarize, translate, route, coach and complete approved actions inside live interactions.

Executive move	Classify use cases as automate, assist, approve or human-only. Require evaluation, auditability and a safe handoff.

TREND 02

UCaaS and CCaaS converge around shared context

Meetings, messaging, voice, service history and work queues will need a common interaction spine.

Executive move	Map identity, routing, recording, CRM, knowledge and workflow dependencies before platform renewal.

TREND 03

The contact centre becomes an intelligence hub

Conversation data will inform products, operations, risk, workforce planning and revenue.

Executive move	Select three enterprise questions that interaction data must answer and assign insight-to-action owners.

TREND 04

Journey orchestration replaces channel expansion

The differentiator will be continuity of intent across channels, bots, teams and systems.

Executive move	Redesign one high-volume journey around preserved context, exception ownership and next-best action.

TREND 05

Real-time augmentation reshapes frontline work

Employees will receive live knowledge, translation, compliance cues and recommended actions.

Executive move	Measure task effort, accuracy and confidence; simplify the desktop before adding more prompts.

TREND 06

Trust, sovereignty and resilience become buying criteria

Identity, consent, data location, fraud controls, emergency calling and continuity will shape decisions.

Executive move	Create a control matrix for data, AI, access, recording, fraud, accessibility and resilience.

TREND 07

Outcome economics replace seat-based thinking

Leaders will evaluate cost per successful outcome, effort, capacity and revenue protection.

Executive move	Baseline outcome measures and model total lifecycle cost - not only per-seat price.

READINESS ASSESSMENT

Seven-factor interaction readiness

Rate each statement from 1 (ad hoc) to 5 (managed). Add the scores and divide by 35 to calculate a percentage.

Factor	Readiness statement	1-5
Platform integration	Voice, meetings, messaging, routing and business systems form a coherent architecture.	
Journey continuity	People can change channel or team without losing intent, identity or history.	
AI maturity	AI use cases have measurable value, evaluation, escalation and accountable owners.	
Knowledge readiness	Trusted knowledge is current, findable, permission-aware and connected to work.	
Workforce enablement	Tools, skills and measures support effective human-AI work.	
Trust and resilience	Security, privacy, accessibility, fraud and continuity controls are owned and tested.	
Outcome economics	Investment decisions use customer, employee, operating and financial outcomes.	

Interpretation: 80-100 Orchestrated / 60-79 Intelligent / 40-59 Connected / below 40 Fragmented. Prioritize the lowest factor and the highest-volume journey it affects.

90-DAY ROADMAP

Move from outlook to controlled evidence

Days 1-30	**Discover**	+ Map platforms, contracts, integrations and interaction data. + Baseline effort, transfers, resolution, capacity and cost. + Select two high-value AI or orchestration use cases. + Name the sponsor and cross-functional outcome owner.
Days 31-60	**Design**	+ Define the target interaction architecture and context model. + Create AI, data, recording, accessibility and oversight guardrails. + Redesign one priority journey and its exception paths. + Prepare knowledge, integration and workforce requirements.
Days 61-90	**Prove**	+ Launch a controlled pilot with a safe fallback. + Train agents, supervisors and process owners. + Measure quality, resolution, effort, adoption, risk and cost. + Approve the next phase using observed evidence.

Measure the outcome, not the activity

First-contact resolution quality / customer effort and repeat contact / employee task effort and confidence / cost per successful outcome / revenue or service protected / automation exception and recovery rate.

EXECUTIVE DECISION FRAME

Five questions before the next platform commitment

01
Which outcomes should improve - and what is the current baseline?

02
Where is context lost across channels, teams and systems?

03
Which AI actions may run autonomously, and which require approval?

04
What evidence proves security, privacy, accessibility, resilience and vendor accountability?

05
What will be retired, consolidated or redesigned if the investment proceeds?

SOURCE NOTES

Evidence informing the outlook

This is a forward-looking synthesis of current standards, public guidance and platform direction. It does not assume that every capability will mature on the same schedule.
